Please read the readme pdf file in version 2.0 to see the extent of changes from version 1.
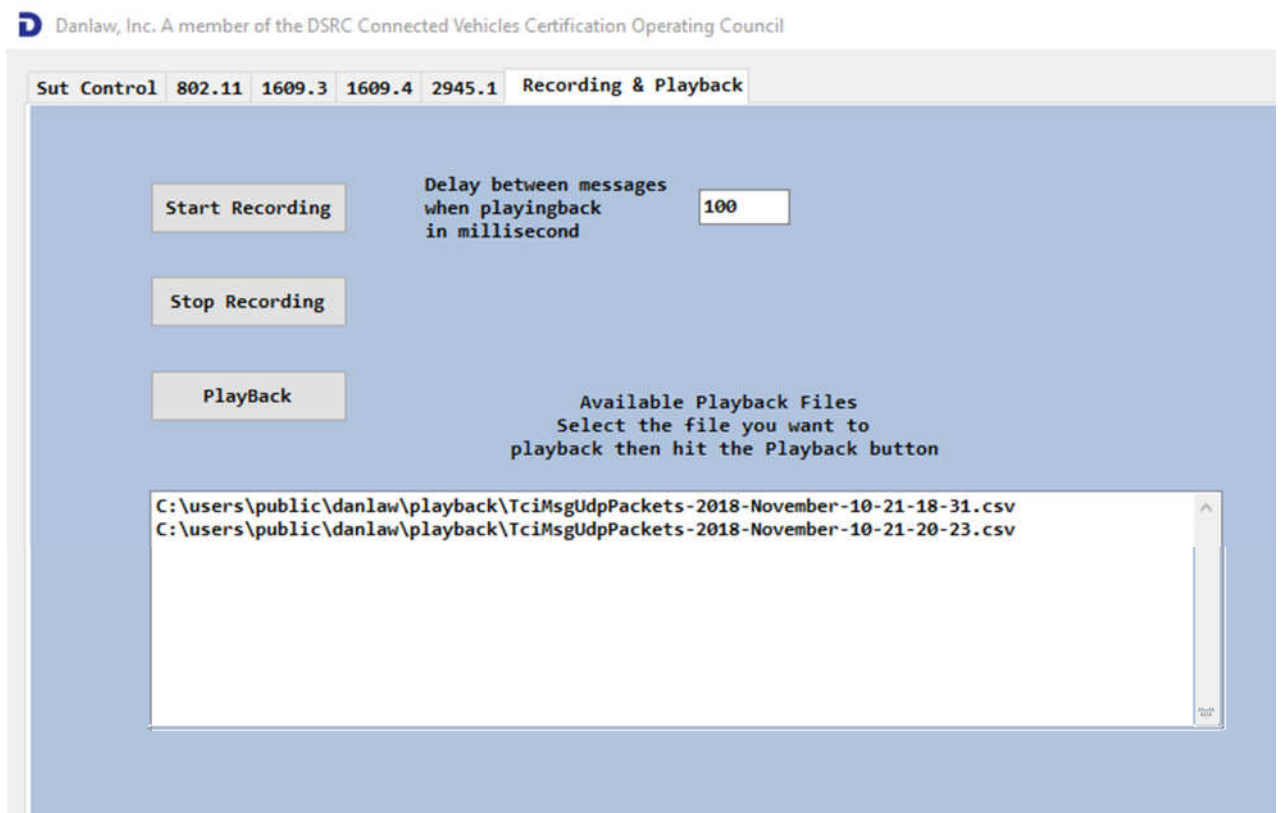

Version 2.1 corrects a couple of bugs and implements a couple of changes.

Bugs:

1- Thanks to Wei-Jyee Leong @keysight.com for discovering that I forgot to implement the eventParamesChoice in the Event Handling section of the receive test. Now, it is there.
2- Also, Dmitri Khijniak discovered that 802.11 setInitialState message was not included in the playback file even if it was sent. This is now corrected.

Changes:

1- The record/playback files have moved to their own directory C:\users\public\danlaw\playback. After you record, you may want to change a file name to a meaningful name instead of a name based on creation time. Just make sure that the file extension remains the same.
2- Another suggestion from Dmitri was to preload the playback files. So now there is a list box with all the files in the directory C:\users\public\danlaw\playback. To playback a file, just select it from the list box and hit the Playback button.
